

Updated Geodatabase for  
Atlas Name: **RI\_CT\_NY\_NJ**  
Date of Atlas: **2001**  
Atlas Number: **71**  
Date of update: **3/30/2011**  
**Processed using ArcMap 10.0**

Changes made:

- Changed hydro layer symbolization
- Modified ESI Values to fit current standard: no changes needed
- Created ri\_carto layer (this allows for symbolization of multiple ESI type lines. It should be used with the ESI lines layer particularly when creating maps. The reference scale should be set to 1:24K)
- Generated atlas specific symbol style (RI\_CT\_NY\_NJ\_ESI.style)
- Set reference scale to "none"
- Modified breed\_dt and source tables and the corresponding links in the biofile & soc\_dat tables to include atlas number, so will be able to integrate multiple atlases. (i.e. breed = 01, became 7100001)
- Updated source links from ESI lines and hydro lines to meet above criteria
- Deleted extraneous fields in each feature class (remnants of arc/info file)
- Reprocessed the ESI polygons, as there was some topology error in the original gdb
- Searched for names that contain commas (Like "\*", "\*"). None replaced
